

GemEx OTC Desk Dashboard: Front-End Development Brief (Next.js & Framer Motion)

Lead Developer Persona: Full Stack Web3 Developer & Expert Web Designer **Project Goal:** To deliver a world-class, high-performance, and visually striking OTC trading dashboard (MVP Phase 1) that instills immediate confidence in its reliability and speed, leveraging a `Dark Mode First` aesthetic.

Technical Stack Mandate:

Component	Technology	Rationale
Framework	Next.js (App Router)	High-performance, Server Components for scale, robust routing structure.
Styling	Tailwind CSS (Custom Config)	Rapid development, responsive utility-first design. Custom GemEx colors are mandatory.
Animation	Framer Motion	Must be used extensively for fluid state transitions, page entry/exit, and micro-interactions.
State Management	React Hooks / Context	Standard approach for scalable, modular state handling.
Wallet/Web3	Ethers/Wagmi (or similar)	For non-custodial wallet connections (future phases, but must be architecturally planned).

1. Visual & Aesthetic Guidelines (The "Coolest Look and Feel")

The application must adhere strictly to the `Dark Mode First` principle, prioritizing the GemEx Color Guide for a high-contrast, professional, and energetic feel.

1.1 Color Palette & Usage (Tailwind Configuration)

Role	Color Name	Hex Code	Usage
Primary Base	Charcoal Grey	#1E1E2B	Main Background, Primary Text (Light Mode).
Surface/Card	Midst Grey	#F0F0F0	Primary Text (Dark Mode), Card/Container Backgrounds (Light Mode).
Primary Accent	Vivid Violet	#641AE4	Primary CTAs, Active States, Navigation Pointers.
Secondary Accent	Neon Lime	#C8F55A	Success Pings, High-Value Data Highlights, 'Live' indicators.
Tertiary Accent	Amethyst Purple	#9A24D2	Subtle gradients, borders, background elements.

Critical Accessibility Rule: The **Neon Lime** (`#C8F55A`) color has poor contrast with Midst Grey. It **must only** be used on Charcoal Grey backgrounds (or dark surfaces) to highlight text or data, ensuring

maximum accessibility.

1.2 Design Philosophy

- **Glassmorphism & Depth:** Utilize subtle background blur effects and transparent Charcoal Grey layers over the main background to create depth and separate dashboard components.
- **Edge & Border Focus:** Employ thin, glowing borders (using Vivid Violet or Neon Lime gradients) around interactive cards, inputs, and action buttons to draw attention to actionable elements.
- **Typography:** Use a clean, modern sans-serif font (e.g., Inter, if available) across the platform. Use bold weights for data points and main headlines.

2. Authentication Flow & UX Journey

The authentication process is the first touchpoint and must be seamless, secure, and visually guided.

2.1 Sign-Up, Login, and Password Reset (Shared Auth UI)

UX Flow Requirement:

1. **Shared Layout:** Sign-up, Login, and Forgot Password screens share a common, striking layout—a massive, centered card (Charcoal Grey, slightly transparent) framed by a subtle Neon Lime or Vivid Violet glow.
2. **Form Transition (Framer Motion):** When a user switches from Login to Sign-Up (or vice versa), the form fields should perform a fast, elegant slide transition (e.g., `slide-up/slide-down` or `fade-in/fade-out`) rather than an instant swap.
3. **Button States:** CTAs (`Login` , `Create Account`) must feature a **Vivid Violet to Amethyst Purple gradient**. On hover, the gradient should reverse or pulsate gently using `Framer Motion` 's `whileHover` property.
4. **Error Handling:** Validation errors should appear immediately and subtly below the field using a small, sharp red text block with a quick `slide-in` animation.

2.2 Post-Registration & KYC Onboarding (Client Flow)

After a successful sign-up, the user must be redirected to a dedicated, multi-step KYC completion flow. This is mandatory before accessing the trading dashboard.

Route	Step	UX/UI Mandate
<code>/auth/onboard/kyc-start</code>	Welcome/Intro	A full-screen modal explaining why KYC is required (Compliance, Security, AML) with GemEx's authoritative tone. Strong use of brand icons.
<code>/auth/onboard/personal</code>	Personal Details	Name, Date of Birth, Address, etc. Input fields use a Neon Lime underline that fills on focus.
<code>/auth/onboard/document</code>	Document Upload (QoreID Integration)	Clear visual drop zones for Passport/ID. Show a high-contrast progress bar. Upon successful upload, the area should flash Neon Lime before showing a "Pending Review" status.

/auth/onboard/wallet	Wallet Verification	Prompt the user to securely connect or verify a withdrawal wallet (potentially non-custodial for future flexibility). This is a trust-building step.
/auth/onboard/pending	Final Status	A striking screen with an animated pending icon (a rotating Vivid Violet ring) and a message: "Verification in Progress. You will be notified via SMS/Email when your account is active."

3. Dashboard Architecture & Next.js Routing

The routing must be structured using Next.js App Router features, utilizing nested layouts for shared components (Header, Sidebar, Role-Specific Menus).

3.1 Base Layout & Shared Components

- **Layout:** /app/(dashboard)/layout.tsx for shared elements (Sidebar, Nav, Footer).
- **Styling:** The overall background is Charcoal Grey. Primary navigation and cards use a slightly lighter, glassmorphed Charcoal Grey variant for depth.

3.2 Role-Based Routing Structure

All primary dashboard routes will be nested under a role-specific group, enforced by middleware on the back-end, but requiring distinct frontend components.

Route Group	Role	Purpose
/app/(client)/...	Client	Trading, account management, history.
/app/(dealer)/...	Dealer	Quote/Trade processing, limited monitoring.
/app/(admin)/...	Admin	System oversight, user/rate management, audit.

4. Role-Specific Dashboard UX & Modules

4.1 Client Dashboard (/client)

Goal: Provide a fast, clear path to trade (request a quote) and track assets.

Module/Route	Path	Key UX/Animation Mandate
Home/Overview	/client/dashboard	Data Visualization Focus. Use bold, Neon Lime text for current fiat balance and a Vivid Violet progress bar for overall monthly transaction volume. The main "Request New Quote" button should be massive and centrally placed.
New Quote Request	/client/trade	A sleek, multi-step form. As the user selects Crypto/Fiat, the associated icons and exchange rates should smoothly transition (e.g., coin icon morphs into Naira icon). The "Get Rate" button activates with a pulsing Vivid Violet effect.

Quotes & Trades	/client/history	Table data should enter with a subtle, staggered row animation. Status tags (Pending , Settled , Canceled) must use Neon Lime for Settled (Success) and a dimmed Charcoal Red for Canceled .
Wallet & Deposit	/client/wallet	A dedicated card displaying the user’s unique deposit address. The "Copy Address" button should provide instant feedback: a quick Neon Lime flash and a message that slides in using Framer Motion.

4.2 Dealer Dashboard (/dealer)

Goal: Efficiently manage open quotes, approve trades, and monitor operational health.

Module/Route	Path	Key UX/Animation Mandate
Home/Monitoring	/dealer/dashboard	The Core Metrics Panel: Display critical metrics from the back-end in large, distinct cards: Total Amount Locked, Awaiting Payouts, Payout Balance, Pending Payouts (Count) . These cards must constantly update using a subtle flicker/pulse animation on the number value (Neon Lime) to indicate real-time data streaming.
Quote Queue	/dealer/quotes	A filterable table showing active quote requests. New requests should appear at the top with a Vivid Violet glow that fades out after 5 seconds to draw immediate attention. Action buttons (Approve , Reject) should use distinct, high-contrast colors (Neon Lime for Approve).
Trade Processing	/dealer/trades/[id]	Detail view for a specific trade. Approval process must feature a highly secure two-step modal confirmation, with the final submission button having an undeniable, weighty press interaction via whileTap .

4.3 Admin Dashboard (/admin)

Goal: System control, audit, user management, and setting firm-wide rates.

Module/Route	Path	Key UX/Animation Mandate
System Settings	/admin/settings	Rate Controls: The ability to set the firm Naira exchange rate must be a protected module. Rate input fields should be large, clear, and require confirmation via a two-factor-authenticated modal. Any change should trigger a Neon Lime success flash.
User Management	/admin/users	Ability to view and modify user status (Pending KYC , Verified , Suspended). A button to Suspend a user should be a visually alarming, high-contrast Charcoal Red, requiring a multi-step confirmation.
Audit Logs	/admin/audit	Read-only, highly searchable table tracking all Admin/Dealer actions. The entries should be densely but cleanly organized. Use a very subtle, almost imperceptible slide-in effect for each row to enhance the feeling of streaming data integrity.

5. Micro-Interactions & Animation (Framer Motion Mandate)

All interactive elements **must** leverage `Framer Motion` to elevate the user experience, ensuring the platform feels ultra-modern and highly responsive.

Interaction Type	Element	Framer Motion Technique
Page/Module Entry	Main Dashboard Content, Cards	Staggered <code>opacity</code> and <code>y-axis</code> (lift-up) transition on initial load. The entire page should not appear instantly.
Button Feedback	All CTAs (<code>Request Quote</code> , <code>Approve</code>)	Use <code>whileHover</code> to introduce a subtle 3D lift/shadow and <code>whileTap</code> for a firm, satisfying press-down effect. The glow effect should intensify on hover.
Navigation	Sidebar links	Active link highlights should slide smoothly from the previous active state to the new one (e.g., <code>Vivid Violet</code> bar sliding). Inactive links should slightly scale up (<code>scale: 1.02</code>) on hover.
Data Update	Real-time metrics (e.g., <code>Payout Balance</code>)	Use the <code>AnimatePresence</code> and <code>key</code> prop on changing data values to trigger a fast, subtle <code>fade-in/fade-out</code> or a number-rolling animation, emphasizing the live nature of the data.
Error/Success	Notifications	Use a component that slides in sharply from the top right/bottom right corner and auto-disappears with a clean <code>AnimatePresence</code> exit animation. Successes use <code>Neon Lime</code> .

6. Responsivity and Accessibility

The dashboard must be fully responsive, maintaining functionality and aesthetics on mobile, tablet, and desktop viewports.

- 1. **Mobile-First Layout:** The primary dashboard layout (`/client/dashboard`) must collapse into a single-column, scrollable format on mobile (`< 640px`), with key metrics prioritized at the top.
- 2. **Sidebar Behavior:** The persistent sidebar on desktop must convert to an accessible, slide-in/overlay drawer on mobile, triggered by a hamburger menu icon.
- 3. **Data Tables:** Transaction and Quote tables must implement either responsive horizontal scrolling or, preferably, collapse into card-style summaries on mobile, showing only the most critical information (e.g., ID, Status, Amount) with a drill-down option.
- 4. **Accessibility:** Ensure all interactive elements have sufficient tap targets (especially on mobile) and that the high-contrast color scheme is maintained across all components, adhering to the `Neon Lime` contrast mandate.

I recommend starting with the definition of the Tailwind configuration and the Auth UI components first, as they set the visual foundation for the entire application.
